File: ./target/aarch64-apple-darwin/release/build/typenum-5ef8f1658

```
/**
Type aliases for many constants.

This file is generated by typenum's build script.

For unsigned integers, the format is `U` followed by the number. We define

- Numbers 0 through 1024
- Powers of 2 below `u64::MAX`
- Powers of 10 below `u64::MAX`

These alias definitions look like this:

```rust
use typenum::{B0, B1, UInt, UTerm};

# #[allow(dead_code)]
type U6 = UInt<UInt<UInt<UTerm, B1>, B1>, B0>;
```

For positive signed integers, the format is `P` followed by the number and
signed integers it is `N` followed by the number. For the signed integer ze
`Z0`. We define aliases for

- Numbers -1024 through 1024
- Powers of 2 between `i64::MIN` and `i64::MAX`
- Powers of 10 between `i64::MIN` and `i64::MAX`

These alias definitions look like this:

```rust
use typenum::{B0, B1, UInt, UTerm, PInt, NInt};

# #[allow(dead_code)]
type P6 = PInt<UInt<UInt<UInt<UTerm, B1>, B1>, B0>>;
# #[allow(dead_code)]
type N6 = NInt<UInt<UInt<UInt<UTerm, B1>, B1>, B0>>;
```
```

```
# Example
```rust
# #[allow(unused_imports)]
use typenum::{U0, U1, U2, U3, U4, U5, U6};
# #[allow(unused_imports)]
use typenum::{N3, N2, N1, Z0, P1, P2, P3};
# #[allow(unused_imports)]
use typenum::{U774, N17, N10000, P1024, P4096};
```

We also define the aliases `False` and `True` for `B0` and `B1`, respective

File: ./target/aarch64-apple-darwin/release/build/typenum-5ef8f1658

```
/**
Convenient type operations.

Any types representing values must be able to be expressed as `ident`s. Tha
in scope.

For example, `P5` is okay, but `typenum::P5` is not.

You may combine operators arbitrarily, although doing so excessively may re
recursion limit.

# Example
```rust
#![recursion_limit="128"]
#[macro_use] extern crate typenum;
use typenum::consts::*;

fn main() {
    assert_type!(
        op!(min((P1 - P2) * (N3 + N7), P5 * (P3 + P4)) == P10)
    );
}
```
Operators are evaluated based on the operator precedence outlined
[here](https://doc.rust-lang.org/reference.html#operator-precedence).

The full list of supported operators and functions is as follows:

`*`, `/`, `%`, `+`, `-`, `<<`, `>>`, `&`, `^`, `|`, `==`, `!=`, `<=`, `>=`,

They all expand to type aliases defined in the `operator_aliases` module. H
including examples:

Operator `*`. Expands to `Prod`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(P2 * P3), P6);
# }
```
```

Operator `/`. Expands to `Quot`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(P6 / P2), P3);
# }
```

Operator `%`. Expands to `Mod`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(P5 % P3), P2);
# }
```

Operator `+`. Expands to `Sum`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(P2 + P3), P5);
# }
```

Operator `-`. Expands to `Diff`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(P2 - P3), N1);
# }
```

Operator `<<`. Expands to `Shleft`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
```

```
assert_type_eq!(op!(U1 << U5), U32);
# }
```

Operator `>>`. Expands to `Shright`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(U32 >> U5), U1);
# }
```

Operator `&`. Expands to `And`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(U5 & U3), U1);
# }
```

Operator `^`. Expands to `Xor`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(U5 ^ U3), U6);
# }
```

Operator `|`. Expands to `Or`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(U5 | U3), U7);
# }
```

Operator `==`. Expands to `Eq`.

```rust
```

```
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(P5 == P3 + P2), True);
# }
```

Operator `!=`. Expands to `NotEq`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(P5 != P3 + P2), False);
# }
```

Operator `<=`. Expands to `LeEq`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(P6 <= P3 + P2), False);
# }
```

Operator `>=`. Expands to `GrEq`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(P6 >= P3 + P2), True);
# }
```

Operator `<`. Expands to `Le`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(P4 < P3 + P2), True);
# }
```

Operator `>`. Expands to `Gr`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(P5 < P3 + P2), False);
# }
```

Operator `cmp`. Expands to `Compare`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(cmp(P2, P3)), Less);
# }
```

Operator `sqr`. Expands to `Square`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(sqr(P2)), P4);
# }
```

Operator `sqrt`. Expands to `Sqrt`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(sqrt(U9)), U3);
# }
```

Operator `abs`. Expands to `AbsVal`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(abs(N2)), P2);
# }
```

```

---
Operator `cube`. Expands to `Cube`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(cube(P2)), P8);
# }
```

Operator `pow`. Expands to `Exp`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(pow(P2, P3)), P8);
# }
```

Operator `min`. Expands to `Minimum`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(min(P2, P3)), P2);
# }
```

Operator `max`. Expands to `Maximum`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(max(P2, P3)), P3);
# }
```

Operator `log2`. Expands to `Log2`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
```
```

```
# fn main() {
assert_type_eq!(op!(log2(U9)), U3);
# }
```

Operator `gcd`. Expands to `Gcf`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(gcd(U9, U21)), U3);
# }
```

File: ./target/release/build/typenum-346c6668244bcd95/out/consts.r

```
/**
Type aliases for many constants.

This file is generated by typenum's build script.

For unsigned integers, the format is `U` followed by the number. We define

- Numbers 0 through 1024
- Powers of 2 below `u64::MAX`
- Powers of 10 below `u64::MAX`

These alias definitions look like this:

```rust
use typenum::{B0, B1, UInt, UTerm};

# #[allow(dead_code)]
type U6 = UInt<UInt<UInt<UTerm, B1>, B1>, B0>;
```

For positive signed integers, the format is `P` followed by the number and
signed integers it is `N` followed by the number. For the signed integer ze
`Z0`. We define aliases for

- Numbers -1024 through 1024
- Powers of 2 between `i64::MIN` and `i64::MAX`
- Powers of 10 between `i64::MIN` and `i64::MAX`

These alias definitions look like this:

```rust
use typenum::{B0, B1, UInt, UTerm, PInt, NInt};

# #[allow(dead_code)]
type P6 = PInt<UInt<UInt<UInt<UTerm, B1>, B1>, B0>>;
# #[allow(dead_code)]
type N6 = NInt<UInt<UInt<UInt<UTerm, B1>, B1>, B0>>;
```

Example
```rust
# #[allow(unused_imports)]
use typenum::{U0, U1, U2, U3, U4, U5, U6};
# #[allow(unused_imports)]
use typenum::{N3, N2, N1, Z0, P1, P2, P3};
# #[allow(unused_imports)]
use typenum::{U774, N17, N10000, P1024, P4096};
```
```

```
We also define the aliases `False` and `True` for `B0` and `B1`, respective

File: ./target/release/build/typenum-346c6668244bcd95/out/op.rs

```
/**
Convenient type operations.
```

Any types representing values must be able to be expressed as `ident`s. Tha
in scope.

For example, `P5` is okay, but `typenum::P5` is not.

You may combine operators arbitrarily, although doing so excessively may re
recursion limit.

Example
```rust
#![recursion_limit="128"]
#[macro_use] extern crate typenum;
use typenum::consts::*;

fn main() {
    assert_type!(
        op!(min((P1 - P2) * (N3 + N7), P5 * (P3 + P4)) == P10)
    );
}
```
Operators are evaluated based on the operator precedence outlined
[here](https://doc.rust-lang.org/reference.html#operator-precedence).

The full list of supported operators and functions is as follows:

`*`, `/`, `%`, `+`, `-`, `<<`, `>>`, `&`, `^`, `|`, `==`, `!=`, `<=`, `>=`,

They all expand to type aliases defined in the `operator_aliases` module. H
including examples:

Operator `*`. Expands to `Prod`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(P2 * P3), P6);
# }
```

Operator `/`. Expands to `Quot`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(P6 / P2), P3);
# }
```

Operator `%`. Expands to `Mod`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(P5 % P3), P2);
# }
```

Operator `+`. Expands to `Sum`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(P2 + P3), P5);
# }
```

Operator `-`. Expands to `Diff`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(P2 - P3), N1);
# }
```

Operator `<<`. Expands to `Shleft`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(U1 << U5), U32);
# }
```

Operator `>>`. Expands to `Shright`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
```

```
assert_type_eq!(op!(U32 >> U5), U1);
# }
```

Operator `&`. Expands to `And`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(U5 & U3), U1);
# }
```

Operator `^`. Expands to `Xor`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(U5 ^ U3), U6);
# }
```

Operator `|`. Expands to `Or`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(U5 | U3), U7);
# }
```

Operator `==`. Expands to `Eq`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(P5 == P3 + P2), True);
# }
```

Operator `!=`. Expands to `NotEq`.

```rust
```

```
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(P5 != P3 + P2), False);
# }
```

Operator `<=`. Expands to `LeEq`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(P6 <= P3 + P2), False);
# }
```

Operator `>=`. Expands to `GrEq`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(P6 >= P3 + P2), True);
# }
```

Operator `<`. Expands to `Le`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(P4 < P3 + P2), True);
# }
```

Operator `>`. Expands to `Gr`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(P5 < P3 + P2), False);
# }
```

Operator `cmp`. Expands to `Compare`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(cmp(P2, P3)), Less);
# }
```

Operator `sqr`. Expands to `Square`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(sqr(P2)), P4);
# }
```

Operator `sqrt`. Expands to `Sqrt`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(sqrt(U9)), U3);
# }
```

Operator `abs`. Expands to `AbsVal`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(abs(N2)), P2);
# }
```

Operator `cube`. Expands to `Cube`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(cube(P2)), P8);
# }
```

```

---
Operator `pow`. Expands to `Exp`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(pow(P2, P3)), P8);
# }
```

Operator `min`. Expands to `Minimum`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(min(P2, P3)), P2);
# }
```

Operator `max`. Expands to `Maximum`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(max(P2, P3)), P3);
# }
```

Operator `log2`. Expands to `Log2`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
# fn main() {
assert_type_eq!(op!(log2(U9)), U3);
# }
```

Operator `gcd`. Expands to `Gcf`.

```rust
# #[macro_use] extern crate typenum;
# use typenum::*;
```
```

```
# fn main() {
assert_type_eq!(op!(gcd(U9, U21)), U3);
# }
```

File: ./target/x86_64-pc-windows-gnu/release/build/typenum-10a9d0

````
/**
Type aliases for many constants.

This file is generated by typenum's build script.

For unsigned integers, the format is `U` followed by the number. We define

- Numbers 0 through 1024
- Powers of 2 below `u64::MAX`
- Powers of 10 below `u64::MAX`

These alias definitions look like this:

```rust
use typenum::{B0, B1, UInt, UTerm};

# #[allow(dead_code)]
type U6 = UInt<UInt<UInt<UTerm, B1>, B1>, B0>;
```

For positive signed integers, the format is `P` followed by the number and
signed integers it is `N` followed by the number. For the signed integer ze
`Z0`. We define aliases for

- Numbers -1024 through 1024
- Powers of 2 between `i64::MIN` and `i64::MAX`
- Powers of 10 between `i64::MIN` and `i64::MAX`

These alias definitions look like this:

```rust
use typenum::{B0, B1, UInt, UTerm, PInt, NInt};

# #[allow(dead_code)]
type P6 = PInt<UInt<UInt<UInt<UTerm, B1>, B1>, B0>>;
# #[allow(dead_code)]
type N6 = NInt<UInt<UInt<UInt<UTerm, B1>, B1>, B0>>;
```

# Example
```rust
# #[allow(unused_imports)]
use typenum::{U0, U1, U2, U3, U4, U5, U6};
# #[allow(unused_imports)]
use typenum::{N3, N2, N1, Z0, P1, P2, P3};
# #[allow(unused_imports)]
use typenum::{U774, N17, N10000, P1024, P4096};
```
````

```
We also define the aliases `False` and `True` for `B0` and `B1`, respective
